

Introducing Sidecar

The missing link that utilises the tools you already have to power bespoke, high-quality web applications.

Productivity suites like Office 365 and Google Workspace are utilities as essential as electricity and water for business today but often you only use a fraction of what you pay for.

Sidecar is a toolkit for building bespoke websites, portals and applications that leverages the productivity suite you already uses like Office 365, Sharepoint and OneDrive.

As we've been building projects over the last few years, it's been frustrating to see the amount of development time that's spent on predictable basics; admin portals, account systems, permissions and data storage.

Even a simple website in 2023 can be a difficult project to achieve and the result can be brittle and expensive. Worse than that, when complete, it's often not adopted properly because it's difficult to use or has account switching friction.

With Sidecar, we create a completely bespoke, cloud-based website using the existing backbone of Office 365's permissions system, SharePoint, and OneDrive.

Unique benefits maximizing value

Save time and reduce costs:

- Sidecar eliminates time-consuming tasks such as administrative portals, SSO, internal integration, and onboarding, reducing administration and onboarding to virtually zero.
- Sidecar combines the development and digital transformation cost savings by utilising the tools you already use day-to-day. This eliminates a whole class of expensive work like administrative portals, SSO or different accounts, internal integration and onboarding, API creation, data security and privacy.
- Automatic Updates: When users update content in OneDrive, Sidecar automatically starts a process that updates the website.
- SharePoint includes virtually unlimited data storage and free access to the Microsoft Graph API. This means that core of your bespoke solution is already paid for.

Flexible solution:

- Unlike other solutions, Sidecar does not lock users into a specific vendor or tool. It can integrate with any service, account system, or API, and the website or application remains your intellectual property.
- Sidecar is designed to support a variety of different kind of authentication, account and permissions. This allows everyone from internal colleges, customer & partner accounts or anonymous visitors to access your solution securely and safely.

Using Sidecar to power your projects means we can make it safer and easier to use while ensuring your budget is focused on a solution that improves your business rather than on development busywork.

Direct Access

- Full read, edit and delete interactivity
- Login with Office 365 account
- No server-side data processing
- Uses existing permissions model

Smart Proxy

- Full read, edit and delete interactivity
- Custom account system with additional security and privacy
- Single, secure application access to OneDrive & SharePoint
- Custom, flexible permissions model

Smart Publish

- Read-only, anonymous access
- Perfect for marketing or documentation site
- Super-fast loading speed
